EMPLOYEE RAISE ISSUE

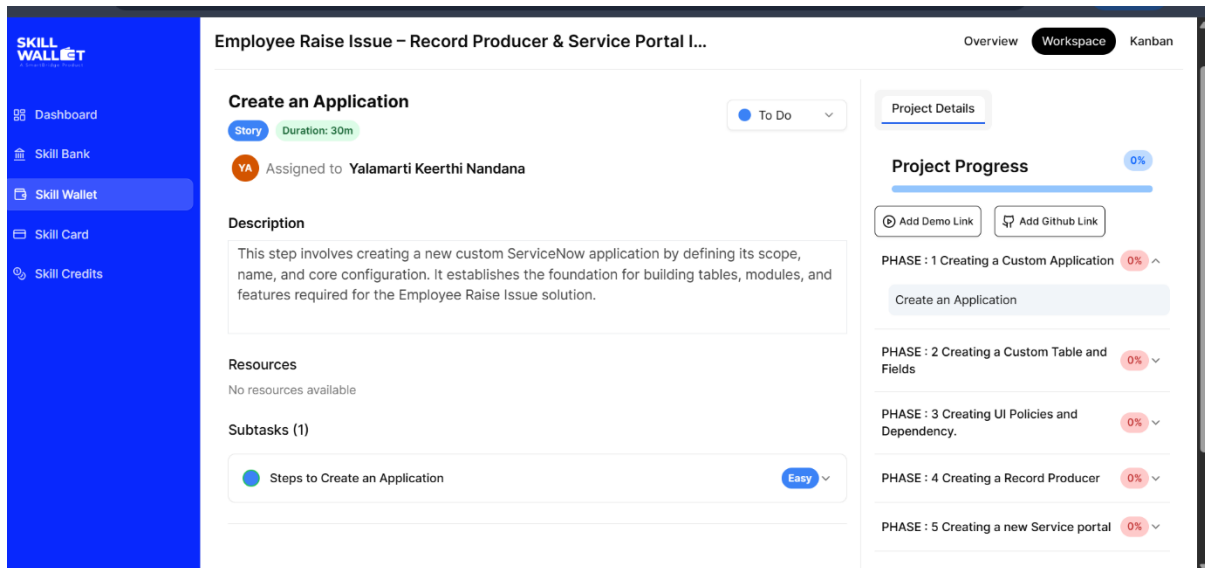

Record Producer & Service Portal Integration - PHASE 1

Creating a Custom Application

1. Introduction

The **Employee Raise Issue** project is developed using the **ServiceNow platform** to provide employees with a simple and efficient way to report workplace issues or concerns.

The system allows employees to submit an issue through a Service Portal. The submitted information is captured using a **Record Producer** and stored in a custom ServiceNow table. This helps the responsible team track, manage, and resolve employee issues efficiently.

2. Project Objective

The main objective of this project is to create an easy-to-use system through which employees can raise issues in the organization.

The project aims to:

- Allow employees to submit issues through the Service Portal.
- Capture important issue details such as category, priority, and description.
- Store submitted issues in a ServiceNow table.
- Provide a structured way to manage employee issues.
- Improve issue tracking and resolution.

- Reduce manual communication for reporting workplace problems.
-

3. Problem Statement

In a traditional organization, employees may report issues through emails, phone calls, or direct communication with the support team. This can make it difficult to properly track and manage every issue.

To overcome this problem, the **Employee Raise Issue** application provides a centralized ServiceNow-based solution where employees can submit their concerns and the support team can manage them systematically.

4. Technologies Used

The following technologies/features are used in this project:

- **ServiceNow**
 - **Custom Table**
 - **Record Producer**
 - **Service Portal**
 - **Catalog Item / Service Catalog**
 - **Form Fields**
 - **Application/Module Configuration**
-

5. Phase 1 – Project Setup and Planning

Phase 1 focuses on understanding the project requirements and preparing the basic structure required for implementation.

The major activities performed in Phase 1 are:

1. Understanding the project requirements.
2. Creating/setting up the application.
3. Creating the custom table.
4. Identifying the required fields.
5. Configuring the basic data structure.

6. Preparing the project for Record Producer and Service Portal integration.

6. Application Creation

A dedicated application is created in ServiceNow for the **Employee Raise Issue** functionality.

The application acts as the main container for the tables, modules, forms, and other configurations required for the project.
