

EMPLOYEE RAISE ISSUE

Record Producer & Service Portal Integration

PHASE 2

Creating a Custom Table and Fields

1. Introduction

Phase 2 of the Employee Raise Issue project focuses on creating a custom table and defining the fields required to store Employee Raise Issue records. This establishes the data structure required for capturing and managing issue details in the application.

2. Phase 2 Objective

The objective of this phase is to create the Employee Raise Issue custom table and configure the required fields using ServiceNow. The table provides a structured place for issue records, while the fields capture the information needed for each issue.

- Navigate to Tables under System Definition.
- Create a new custom table.
- Set the table label and name.
- Enable Auto-numbering for issue records.
- Configure the required fields using Form Design.

3. Phase 2 Overview

Item	Details
Project	Employee Raise Issue – Record Producer & Service Portal Integration
Phase	Phase 2
Phase Name	Creating a Custom Table and Fields
Duration	1 Hour
Main Activities	Custom table creation and field configuration
Platform	ServiceNow

4. Phase 2 Task Overview

The Skill Wallet task describes Phase 2 as creating a custom table to store Employee Raise Issue records and defining necessary fields such as short description, category, priority, and description.

5.2 Create a New Table

Click New in the top-right corner to open the table creation form.

ServiceNow | All | Favorites | History | Workspaces | Admin | Table - New Record | Application scope: Employee Center | Update set: Default [Employee Center]

Table - New record

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table. Applications use tables and records to manage data and processes. [More Info](#)

Insert a new row...					

5.3 Enter Table Details

In the table form, provide the required table details as specified in the Phase 2 instructions:

- Label: Employee raises issue.
- Name: Use the auto-populated value generated by ServiceNow.
- Under Controls, enable the Auto-number option.
- Save the form from the context menu.

ServiceNow | All | Favorites | History | Workspaces | Admin | Table - Employee raises issue | Application scope: Employee Center | Update set: Default [Employee Center]

Table - Employee raises issue

This record is in the Employee Center application, but Employee center is the current application. To edit this record click here. [SN Utils] Switch to Employee Center application click here

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table. Applications use tables and records to manage data and processes. [More Info](#)

Table Columns Search

Dictionary Entries

Column label	Type	Reference	Max length	Default value	Display
State	String	(empty)	40		false
Updated by	String	(empty)	40		false
Updates	Integer	(empty)	40		false
Category	String	(empty)	40		false
Priority	String	(empty)	40		false
Updated	Date/Time	(empty)	40		false
Requester	Reference	User	32		false
Assignment group	Reference	User	32		false
Number	String	(empty)	40	javascript:global.getNextObjNumberPadded();	false
Sys ID	Sys ID (GUID)	(empty)	32		false
Created by	String	(empty)	40		false
subcategory	String	(empty)	40		false

6. Auto-Number Configuration

Auto-numbering is enabled under the Controls section of the table form. This provides an automatically generated identifying number for issue records. The Phase instructions show an Auto-number configuration

with a prefix, starting number, and number-of-digits setting. Use the values actually configured in your ServiceNow instance.

7. Creating Fields

After creating the table, the required fields are configured through the form design process. Under Related Links, click Show Form. Then open the context menu and select Configure → Form Design. Create the required fields using the specified names and types.

Column label	Type	Reference	Max length	Default value	Display
State	String	(empty)	40		false
Updated by	String	(empty)	40		false
Updates	Integer	(empty)	40		false
Category	String	(empty)	40		false
Priority	String	(empty)	40		false
Updated	Date/Time	(empty)	40		false
Requester	Reference	User	32		false
Assignment group	Reference	User	32		false
Number	String	(empty)	40	javascript:global.getNextObjNumberPadded();	false
Sys ID	Sys ID (GUID)	(empty)	32		false
Created by	String	(empty)	40		false
subcategory	String	(empty)	40		false
short description	String	(empty)	40		false

8. Required Field Definitions

Field Label	Type	Notes
Number	Auto-Number	—
Requester	Reference	(sys user) table
Category	Choice	Network, Hardware, Software,

		Access
Subcategory	Choice	VPN, Laptop, Server, Forgot password
Short description	String	—
State	Choice	New, In progress, Resolved, Closed
Priority	Choice	Critical, High, Medium, Low
Assignment Group	Reference	(sys_user_group) table

9. Verification of Table and Fields

After configuring the table and fields, verify that the table contains the required field structure and that the fields are available on the form. Confirm that the field labels, types, and choice/reference configurations match the Phase 2 requirements.

10. Phase 2 Result

At the end of Phase 2, the custom Employee Raise Issue table and its required fields are configured in ServiceNow. The table provides the data structure needed to capture employee issue information. The configured fields support issue identification, requester information, category and subcategory selection, description, state, priority, and assignment group.

11. Conclusion

Phase 2 establishes the data structure for the Employee Raise Issue application. The custom table and configured fields provide the foundation required for the next implementation stages, including UI policies, Record Producer creation, Service Portal configuration, widgets, and testing.
