

EMPLOYEE RAISE ISSUE

PHASE 3

Employee Raise Issue – UI Policies & Field Dependency

1. Project Overview

The project is an Employee Raise Issue application in ServiceNow. Phase 3 focuses on improving form behaviour by configuring UI Policies and creating a dependency between Category and Subcategory fields. These configurations control when a field becomes mandatory, when a field is read-only, and which subcategory choices are displayed for a selected category.

2. Objectives of Phase 3

- Make the Short description field mandatory when State is New.
- Make the Number field read-only using a UI Policy.
- Create a dependency so Subcategory choices are filtered according to Category.
- Validate that the configured form behaviour works as expected.

3. Configuration Summary

Configuration	Table / Field	Condition / Setting	Expected Behaviour
UI Policy – Mandatory	Employee Raise Issue → Short description	State is New; Mandatory = True	Short description becomes mandatory when State is New.
UI Policy – Read Only	Employee Raise Issue → Number	No filter; Read only = True	Number field cannot be edited through the form.
Field Dependency	Subcategory dependent on Category	Dependent field = Category	Subcategory choices are shown according to the selected Category.

4. UI Policy 1 – Make Short Description Mandatory

Purpose: Ensure that an employee provides a short description whenever the issue State is New.

Steps

1. Open the ServiceNow application and navigate to All → search for UI Policies.
2. Select New to create a new UI Policy.
3. Set the Table to Employee Raise Issue.
4. Configure the condition under When to apply so that State is New.
5. Save the UI Policy.
6. In the related list, open the UI Policy Actions section and select New.
7. Select the Short description field.
8. Set Mandatory to True.
9. Leave Visible and Read only unchanged.

10. Submit the UI Policy Action and update the UI Policy.

Result: When State = New, the Short description field is mandatory. This helps prevent incomplete issue records.

5. UI Policy 2 – Make Number Field Read Only

Purpose: Prevent users from manually changing the automatically maintained Number value.

11. Navigate to UI Policies and select New.
12. Set the Table to Employee Raise Issue.
13. No filter condition is required for this UI Policy.
14. Save the UI Policy.
15. Under the related UI Policy Actions list, select New.
16. Choose the Number field.
17. Set Read only to True.
18. Leave Mandatory and Visible unchanged.
19. Submit the action and update the UI Policy.

Result: The Number field is displayed as read-only on the form, so the user cannot edit it through the UI.

6. Field Dependency – Category and Subcategory

Purpose: Display only the relevant Subcategory choices after the user selects a Category. The recording configures Subcategory as dependent on Category through the dictionary/choice configuration.

20. Open the Employee Raise Issue table form.
21. Right-click the Subcategory field and select Configure Dictionary.
22. In the dictionary form, open the Advanced view from the Related Links area.
23. Set the dependent field to Category.
24. In the Related Links area, open the Choice section.
25. Configure the backend names/values of the Category choices against the corresponding Subcategory choices.
26. Save/update the configuration.
27. Test the form by selecting different Category values and checking the Subcategory choices.

7. Dependency Mapping Used in the Project

Category	Subcategory
Network	VPN
Hardware	Laptop
Software	Server
Access	Forgot password

Example: If Category is selected as Network, the Subcategory list should show VPN. Similarly, Hardware → Laptop, Software → Server, and Access → Forgot password.

8. Testing and Validation

Test Case	Expected Result	Validation
State = New	Short description is mandatory.	Pass when the form prevents submission without a short description.

Number field	Number is read-only.	Pass when the user cannot edit the Number field.
Category = Network	Subcategory shows VPN.	Pass when only the configured dependent choice is available.
Category = Hardware	Subcategory shows Laptop.	Pass when the dependent choice changes correctly.
Category = Software	Subcategory shows Server.	Pass when the dependent choice changes correctly.
Category = Access	Subcategory shows Forgot password.	Pass when the dependent choice changes correctly.

9. Business Value

- UI Policies improve data quality by enforcing required information at the appropriate state.
- Read-only control protects system-generated information such as the Number field from manual modification.
- Field dependency makes the form easier to use by showing relevant Subcategory choices instead of unrelated options.
- Together, these configurations make the Employee Raise Issue form more controlled and user-friendly.

10. Technologies / ServiceNow Features Used

- ServiceNow Custom Application
- Employee Raise Issue custom table
- UI Policies
- UI Policy Actions
- Dictionary configuration / Advanced view
- Choice and dependent-field configuration
- ServiceNow form validation

11. Interview / Viva Explanation

“In Phase 3 of my ServiceNow Employee Raise Issue project, I configured UI Policies and field dependency. First, I made Short description mandatory when the State is New. Next, I created another UI Policy to make the Number field read-only. I also configured Subcategory as dependent on Category, so relevant choices such as Network–VPN, Hardware–Laptop, Software–Server, and Access–Forgot password are displayed based on the selected Category. Finally, I tested the form to verify that the mandatory, read-only, and dependency behaviours work correctly.”

12. Conclusion

Phase 3 successfully adds controlled form behaviour to the Employee Raise Issue application. The UI Policies enforce field rules, while the Category–Subcategory dependency improves data selection and usability. These configurations form an important foundation for the later Record Producer and Service Portal phases.

Creating Dependency

StoryDuration: 20m

YAAssigned to Yalamarti Keerthi Nandana

Description

Steps :

- Open the Employee Raise Issue table Form.
- Right Click the Subcategory field and select the **configure dictionary**.
- Now it opens a new form then under Related links select the **Advanced view**.
- Choose the dependent field : Category.**
- Then Under related links Select the choice Section.
- Then give the backend names of category field choice values to the Subcategory Field choice for which option we need to display based on category.
- Then Based on category values Subcategory values displays.
- Network → VPN.**
- Hardware → Laptop.**
