

PHASE 8

CONCLUSION

Employee Raise Issue – Record Producer & Service Portal Integration

8.1 Introduction

The Employee Raise Issue – Record Producer & Service Portal Integration project was successfully implemented using ServiceNow. The project provides a structured way for employees to raise issues through a dedicated Service Portal and Record Producer.

The solution combines a custom application, custom table, UI Policies, Record Producer, Service Portal, and custom widgets to provide an end-to-end issue submission process.

8.2 Project Outcomes

The implementation provides the following outcomes:

- Standardized employee issue submission.
- A dedicated table for storing employee-raised issues.
- Controlled selection of category and subcategory.
- UI Policies to enforce required fields and business conditions.
- A Record Producer for creating employee issue records.
- A dedicated Service Portal for accessing the issue submission functionality.
- Custom widgets to improve the portal user experience.
- Integration between the Service Portal and backend records.
- Better visibility of submitted employee issues.
- Reduced manual effort and improved data consistency.

8.3 Testing and Validation

The implemented functionality was tested by creating employee issue records through the Service Portal and verifying that the submitted information was available in the corresponding ServiceNow table.

The testing covered:

1. Opening the Employee Raise Issue form.
2. Entering requester information.
3. Selecting category and subcategory.
4. Setting the required priority.
5. Entering the short description.
6. Submitting the issue.
7. Verifying the generated employee issue number.

8. Checking the created record in the backend table.
9. Validating the Service Portal and widget functionality.

The testing confirmed that the major components of the application work together as intended.

8.4 Benefits

The completed solution provides a simple and structured process for employees to report issues. It improves consistency in issue submission and helps maintain the submitted information in a centralized ServiceNow table.

The Service Portal provides a user-friendly interface, while the Record Producer connects the portal submission with the backend employee issue table.

8.5 Conclusion

The Employee Raise Issue – Record Producer & Service Portal Integration project successfully demonstrates how ServiceNow can be used to build a customized issue-management solution.

The project integrates the frontend Service Portal with backend records and uses UI Policies, Record Producer functionality, and custom widgets to provide a complete issue-submission workflow.

Overall, the implementation achieves the intended objective of providing employees with a standardized and accessible method to raise issues while maintaining the submitted records within ServiceNow.
